                                                                                                                                   g
                                                                                          셤
                                                                                                                ò
                                                                    ò
                                                                 AAT12704-T12709 and AAT12961-T12974 represent hepatitis C virus (HCV) E1 and E2 protein coding sequence constructs. These sequences are included in vectors for the production of recombinant E1, E2, and E1/E2 proteins. The recombinant proteins on then be isolated using a method of the The recombinant proteins and then be isolated using a method of the carrying out a disulphide bond cleavage, or a reduction step with a carrying out a disulphide bond cleavage of recombinant host cells. The constructs containing the purified HCV envelope proteins can be used to vaccinating humans against HCV, for in vitro detection of HCV for vaccinating humans against HCV, for in vitro detecting one or antibodies in a sample, and in a serotyping assay for detecting one or constructs can also be immobilised on a solid substrate and incorporated constructs can also be immobilised on a solid substrate and incorporated contour second phase hybridisation assay for determining the presence or the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed E1, E2 and E1/E2, and conformation method preserves the conformation of the recombinantly expressed E1, E2 and E1/E2, and are more reactive with human sera than those isolated by known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             540

The vaccines useful for inducing HCV-specific antibodies or for immunising humans against HCV. The recombinant HCV B1 and/or B2 proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody tests, for raising antibodies, in the preparation of medicament, and for the vaccines of patients suffering from HCV infection. The present sequence treatment of patients suffering from HCV infection. The present sequence is a coding sequence described in the exemplification of the invention.

The present invention relates to new therapeutic vaccine compositions for inducing hepatitis C virus (HCW)-specific antibodies, comprising a composition containing at least one purified recombinant HCV single or specific oligomeric recombinant envelope proteins selected from an B1 and an B2 protein, and optionally a pharmaceutical adjuvant. The vaccines are useful for inducing HCV-specific antibodies or for immunising humans against HCV The recombinant HCV B1 and/or B2 proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody tests, for raising antibodies, in the preparation of medicament, and for in vitro monitoring of HCV disease or prognosing the response to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GACCTCTGCGGGATCTGTTTCCTCGTCTCCCAGCTGTTCACCATCTCGCCTCGCCGGCAT 543
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             is a coding sequence described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GAGGACGCGTGAACTATGCAACAGGGAATTTGCCCCGGTTGCTCTTTCTCTATCTTCTCT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and E2 protein coding sequence constructs. These sequences are included in vectors for the production of recombinant E1, E2, and E1/E2 proteins. The recombinant E1, E2, and E1/E2 proteins. The recombinant E1, E2, and E1/E2 proteins. The recombinant proteins can then be isolated using a method of the invention. In the method, the envelope proteins are purified by carrying out a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage, or a reduction step with a carrying out a disulphide bond cleavage, or a reduction step with a carrying out a disulphide bond cleavage in a serving of recombinant host cells. The constructs containing the purified HCV envelope proteins can be used for vaccinating humans against HCV, for in vitro detection of HCV mare amitibodies in a sample, and in a servicyping assay for detecting one or more serological types of HCV present in a biological sample. The constructs can also be immobilised on a solid substrate and incorporated

into a reversed phase hybridisation assay for determining the presence the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed E1, E2 and E1/E2, and eliminates contaminating proteins. Antigens isolated using this method are more reactive with human sera than those isolated by known

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ą
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAT12704-T12709 and AAT12961-T12974 represent hepatitis C virus (HCV) E1
and E2 protein coding sequence constructs. These sequences are included
in vectors for the production of recombinant E1, E2, and E1/E2 proteins.
The recombinant proteins can then be isolated using a method of the
invention. In the method, the envelope proteins are purified by
carrying out a disulphide bond cleavage, or a reduction step with a
disulphide bond cleavage agent, after 19sis of recombinant host cells.
The constructs containing the purified HCV envelope proteins can be used
for vaccinating humans against HCV, for in vitro detection of HCV
constructs can also be immobilised on a solid substrate and incorporated
into a reversed phase hybridisation assay for determining the presence or
the genotype of HCV The new purification method preserves the
conformation of the recombinantly expressed E1, E2 and E1/E2, and
eliminates contaminating proteins. Antigens isolated using this method
are more reactive with human sera than those isolated by known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           302
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               482
                                                                                    The present invention relates to new therapeutic vaccine compositions for inducing hepatitis C virus (HCV)-specific antibodies, comprising a composition containing at least one purified recombinant HV single or specific oligomeric recombinant envelope proteins selected from an E1 and an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are useful for inducing HCV-specific antibodies or for immunising humans vaccines or therapeutics, in HCV SI and/or E2 proteins are useful as vaccines or therapeutics, in the preparation of medicament, and for tests, for raising antibodies, in the preparation of medicament, and for treatment of patients suffering from HCV Infection. The present sequence is a coding sequence described in the exemplification of the invention.

The invention relates to nucleic acid molecules comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) CC internal ribosome entry site (IRES) region coding for one or more NS3, conternal ribosome entry site (IRES) region coding for one or more NS3, CC internal ribosome entry site (IRES) respectively. The location of the materions are detailed in the specification. Also included are CC washing a recomprising a nucleotide sequence coding for the altered nucleic acids, which is transcriptionally coupled to an expense on the altered nucleic acids, (3) a recombinant cell human hepatoma cell comprising the altered nucleic acids (3) a recombinant cell produced by introducing control a human hepatoma cell the altered nucleic acids (4) producing an into a human hepatoma cell the altered nucleic acids (4) producing an control control HCV replicon enhanced cells made in the control of method; and (6) measuring the ability of a compound to affect HCV method; and (6) measuring the ability of a compound to modulate one or more HCV interactions, producing HCV RNA and proteins, and providing a system interactions, producing HCV RNA and proteins, and providing a system interactions the ability of a compound to modulate one or more HCV

The invention relates to nucleic acid molecules comprising altered HCV (CC NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region coding for one or more NS3, internal ribosome entry site (IRES) region coding for one or more NS3, cor EMCV IRES mutations, respectively. The location of the mutations are detailed in the specification. Also included are mutations are detailed in the specification. Also included are comparable acids, which is transcriptionally coupled to an the altered nucleic acids, which is transcriptionally coupled to an exogenous promoter; (2) a recombinant cell buman hepatoma cell comprising control and nucleic acids; (3) a recombinant cell produced by introducing the altered nucleic acids; (3) a recombinant cell produced by introducing an into a human hepatoma cell the altered nucleic acids; (4) producing an expression and expression enhanced cells made in the containing at a therefore a billity of a compound to affect HCV method; and (6) measuring the ability of a compound to affect HCV containing HCV Raplicons and HCV replicon enhanced cells are useful in studying HCV replication and expression, and HCV and host cell cut accover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated was liver failure, cirrhosis and hepatocolellular carcinoma. The present sequence is an HCV replicon on 1 mutant of the invention.

The invention relates to nucleic acid molecules comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) respon coding for one or more NS3, NS5A, or EMCV IRES mutations, respectively. The location of the mexpression vector comprising a nucleotide sequence coding for the altered nucleic acids, which is transcriptionally coupled to an expression vector comprising a nucleotide sequence coding for the altered nucleic acids, which is transcriptionally coupled to an expression acids; (3) a recombinant cell produced by introducing into a human hepatoma cell the altered nucleic acids; (4) producing an CHCV (hepatitis C virus) replicon enhanced cells caids; (4) producing an CHCV (hepatitis C virus) replicon enhanced cells made in the method; and (6) measuring the ability of a compound to affect HCV activity. The HCV replicons and HCV replicon enhanced cells are useful in studying HCV replicons and HCV and host cell cativity. The HCV replicons and expression, and providing a system of interactions, producing HCV RAM and proteins, and providing a system of interactions producing HCV RAM and proteins.

Continue activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activity activities e.g. to discover drugs which may treat HCV mediated activity activities e.g. to discover drugs which may treat HCV mediated activity activities e.g. to discover drugs which may treat HCV mediated activity act ABK91411 and the information in Claim 9.

New Hepatitis C virus (HCV) replicons comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region, useful in studying HCV replication

The invention relates to nucleic acid molecules comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region coding for one or more NS3, internal ribosome entry site (IRES) region coding for one or more NS3, care to the altered nucleic acids, which is transcriptionally coupled to matered nucleic acids, which is transcriptionally coupled to more altered nucleic acids, (3) a recombinant cell human hepatoma cell comprising the altered nucleic acids; (3) a recombinant cell produced by introducing the altered nucleic acids; (3) a recombinant cell produced by introducing into a human hepatoma cell the altered nucleic acids; (4) producing an into a human hepatoma cell the altered nucleic acids; (3) an HCV replicon enhanced cells made in the functional HCV replicons and HCV replicon enhanced cells are useful in studying HCV replicons and HCV replicon enhanced cells are useful in studying HCV replication and expression, and HCV and host cell studying HCV replication and expression, and PCV and host cell studying HCV replication and expression, and PCV and host cell activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities actuence appearing as the present sequence is not shown in the specification but the information in Claim 9.

Note: The present sequence is not shown in the specification but we was created by the information in Claim 9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1176 GATCTCTGCGGATCTGTTTTCCTCGTCGCCCAGCTGTTCACCTTCTCGCCTCGCCGGCAC 1235

```
the altered nucleic acids, which is transcriptionally coupled to an exogenous promoter; (2) a recombinant cell human hepatoma cell comprising the altered nucleic acids; (3) a recombinant cell produced by introducing into a human hepatoma cell the altered nucleic acids; (4) producing an HCV (hepatitis C virus) replicon enhanced cells made in the method; and (6) measuring the ability of a compound to affect HCV activity. The HCV replicons and HCV replicon enhanced cells are useful in studying HCV replicons and HCV replicon enhanced cells are useful in interactions, producing HCV RNA and proteins, and providing a system for measuring the ability of a compound to modulate one or more HCV activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities as liver failure, cirrhosis and hepatoceallular carcinoma. The present sequence is an HCV replicon Con 1 mutant of the invention. Note: The present sequence is not shown in the specification but was created by the indexer using the HCV sequence appearing as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New Hepatitis C virus (HCV) replicons comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region, useful in studying HCV replication and expression -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to nucleic acid molecules comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region coding for one or more NS3, NS5A, or EMCV IRES mutations, respectively. The location of the mutations are detailed in the specification, Also included are (1) an expression vector comprising a nucleotide sequence coding for

                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nucleic acid molecules comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) NS3 or HCV NS5 encoding region, coding for one or more NS3, internal ribosome entry site (IRES) region coding for one or more NS3, CM NSA, or EMCV IRES mutations, respectively. The location of the mutations are detailed in the specification. Also included are mutations are detailed in the specification. Also included are the altered nucleic acids, which is transcriptionally coupled to an the altered nucleic acids, which is transcriptionally coupled to an exogenous promoter; (2) a recombinant cell human hepatoma cell comprising continue a human hepatoma cell the altered nucleic acids; (4) producing an into a human hepatoma cell the altered nucleic acids; (4) producing an cloth (hepatitis C virus) replicon enhanced cells ended in the functional HCV replicon enhanced cells made in the activity. The HCV replicons and HCV replicon enhanced cells are useful in activity. The HCV replicons and HCV replicon enhanced cells are useful in activity. The replicon and HCV replicon enhanced cells are useful in activity. The ability of a compound to modulate one or more HCV extractions, producing HCV RNA and proteins, and providing a system interactions, producing HCV RNA and proteins, and providing a system cor measuring the ability of a compound to modulate one or more HCV activities e.g. to discover drugs which may treat HCV mediated
New Hepatitis C virus (HCV) replicons comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region, useful in studying HCV replication and expression
                                                                                                                                                                                                                                                                                                                                                                                                        /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to nucleic acid molecules comprising altered HCV NSS encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region coding for one or more NS3, NS54, or EMCV IRES mutations, respectively. The location of the mutations are detailed in the specification. Also included are (1) an expression vector comprising a nucleotide sequence coding for the altered nucleic acids, which is transcriptionally coupled to an expression vector acids; (3) a recombinant cell produced by introducing into a human hepatoma cell the altered nucleic acids; (4) producing an HCV (hepatitis C virus) replicon enhanced cells made in the containing a containing HCV replicon; (5) an HCV replicon enhanced cells made in the method; and (6) measuring the ability of a compound to affect HCV activity. The HCV replicons and HCV replicon enhanced cells are useful in the containing HCV replicons and HCV replicon enhanced cells are useful in citeractions, producing HCV RNA and proteins, and providing a system for measuring the ability of a compound to modulate one or more HCV activities e.g. to discover drugs which may treat HCV mediated contained diseases such as liver failure, cirthosis and hepatocellular carcinoms. The present sequence is an HCV replicon on mutant of the invention.

The present sequence is an thought on modulate one or more HCV was created by the indexe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New Hepatitis C virus (HCV) replicons comprising altered HCV NS3 or HC NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region, useful in studying HCV replication and expression
                                                                                                                                                                                                                                                                                                                                                                                                                                         /product= "HCV polyprotein"

The invention relates to nucleic acid molecules comprising altered HCV (C) NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region coding for one or more NS3, conternal ribosome entry site (IRES) region coding for one or more NS3, context of the specification. Also included are mutations are detailed in the specification. Also included are cutations are detailed in the specification. Also included are context on the specification and so the specification and so the altered nucleic acids, which is transcriptionally coupled to a cyogenous promoter; (2) a recombinant cell produced by introducing the altered nucleic acids; (3) a recombinant cell produced by introducing context and entry replicon and electrication enhanced cells made in the functional HCV replicon enhanced cells made in the continuity. The HCV replicons and HCV replicon enhanced cells are useful in studying HCV replication and expression, and HCV and host cell studying HCV replication and expression, and HCV and host cell studying Hc ability of a compound to modulate one or more HCV contexties e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated activities e.g. to discover drugs which may treat HCV mediated by the indexer using the HCV sequence appearing as a greated by the information in Claim 9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         755

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).
The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Geoggawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo,

/note="Vector: pBluescript II SK-; Site_I: EcoRI; Site_2:
Xho1; This library, constructed by John Davies and Jeffrey
McDermott, combines cDNAs from CC-1690 cells grown to
mid-log phase in TAPP (accetate-containing) medium in the
light, TAP medium in the dark, HS (minimal) medium in the
light, TAP medium in the dark, HS (minimal) medium in
ambient levels of CO2 and HS medium bubbled with 5% CO2.
PolyA mRNA was purified from each sample, pooled and cDNA,
synthesized. The cDNA was directionally cloned into lambda
ZAP II (Stratagene) in the EcoRN (5') and Xhol (3') sites,
pBluescript II SK- plasmids were excised from the lambda
ZAP clones by superinfection with ExAssist (Stratagene)
phage. The library was normalized using method 4 described
in Bonaldo et al (1996) Genome Research 6: 791-806."

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
